AB	Disubstituted cucurbit[6]urils and a preparing method thereof are provided, thereby easily introducing the substituents into cucurbit[6]urils, so that cucurbit[6]urils can be covalently bound to biochem. compds., solid surface and solid substrate. The method for preparing disubstituted cucurbit[6]urils comprises reacting glycolurils with formaldehyde.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT

AB Photostability of aqueous solns. xanthene, cyanine, oxazine and coumarin dyes is increased in the presence of cucurbiturils without any essential changing of their absorption spectra and fluorescent quantum yields. Thus, adding 1 - 2 mmol cucurbit[7]uril to 1 - 10 μ m aqueous solution of rhodamine 6G increases its stability to laser irradiation (532 nm) in 30 - 5,000 times depending upon intensity of the irradiation

AB	The invention relates to the use of substances, which release terpenes and/or terpene alcs., for reducing the adhesion of human-pathogenic microorganisms, such as Candida albicans, to biotic and abiotic surfaces, and to cosmetic or pharmaceutical prepsns. containing these substances. Suitable terpenes and/or terpene alcs. are geraniol, farnesol, squalene, patchouli alc. and linalyl acetate. These terpenes and/or terpene alcs. are in the forms of esters with silicic acids or acrylic polymers or in the form of inclusion complexes.

OS MARPAT 144:11604

AB A liposome formed by self-assembling a cucurbituril derivative and a method of preparing the liposome are provided. Liposomes further include a targeting moiety exposed to the outside of the liposome. Organic compds., such as hydrocortisone, prednisolone, spironolactone, testosterone, megestrol acetate, danazole, progesterone, etc., a protein, or a gene are encapsulated as a guest mol. in the liposome. For example, 2.3 mg of {3-[2-(2-(2-methoxyethoxy)ethoxy)ethylsulfanyl]propyloxy}12 cucurbituril was dissolved in 1 mL of Me alc. and the resultant solution was completely dried. About 6 mL of an aqueous solution containing 1 mg of hydrocortisone was added to the dried product, the temperature of a water bath was controlled to 40° and then the product was dispersed in the aqueous solution for 30 min by sonication. The formation of liposomes having sizes of several tens to 1000 nm was observed using a TEM.

I

II

AB Processes of preparing glycolurils, and for preparing cucurbiturils from the glycolurils or other cucurbiturils, both using microwave irradiation, are disclosed. The glycolurils are described by formula I, and the cucurbiturils by formula II [wherein: X = O, S, NH; R1, R2 = (independently) H, (un)substituted alk(en/yn)yl, alkylcarboxyl, hydroxyalkyl, alkoxy, nitroalkyl, (di)(alkyl)amino, (hetero)cycloalkyl, (hetero)aryl; n = 4-20]. Specifically, microwave irradiation allows a variety of condensation and cyclization reactions used for the preparation of industrially widely applied glycoluril and cucurbituril derivs. to be carried out efficiently in a short time. Applicable reactions include: (1) condensation and cyclization of 1,2-dicarbonyl compds. with ureas to give glycolurils, (2) condensation and cyclization reactions between glycolurils and paraformaldehyde or formaldehyde solution to give cucurbiturils, (3) condensation and cyclization of disubstituted glycolurils with unsubstituted glycolurils to give disubstituted glycolurils, and (4) oxidation reactions of cucurbiturils for preparation of hydroxycucurbiturils. The condensing glycolurils can be cyclic-bridged glycolurils, such as I [R1R2 = (CH2)4]. For instance, simple cyclocondensation of urea with glyoxal in the presence of concentrated HCl was carried out in a reactor in an 800-W microwave for 15 s to give the solid parent glycoluril I [X = O, R1 = R2 = H] (III) in 85% yield. Further cyclization of III with paraformaldehyde in 9M H2SO4 with an irradiation time of 45 s, and recrystn. of the products, gave a series of 4 cucurbiturils II [X = O, R1 = R2 = H, (IV): n = 5, 6, 7, 8] with yields of 15%, 45%, 20%, and 15%, resp. Similarly, mixed cyclization of an excess of the unsubstituted glycoluril III with the disubstituted glycoluril I [X = O, R1 = R2 = m-nitrophenyl] and paraformaldehyde in 12M H2SO4 (5 min, 800 W) gave the disubstituted hexameric cucurbituril II [X = O, n = 6, R1 = R2 = H for 5 units, R1 = R2 = m-nitrophenyl for 1 unit] in 17% yield. The oxidation of unsubstituted hexameric cucurbituril IV [n = 6] with K2S2O8 in H2O (5 min, 800 W) gave II [X = O, n = 6, R1 = R2 = OH] in 45% yield. Cyclocondensation of dimethylglycoluril I [X = O, R1 = R2 = Me] with paraformaldehyde in 9M H2SO4 (50 s, 800 W) gave 16% decamethylcucurbituril II [X = O, n = 5, R1 = R2 = Me]. Finally, cyclocondensation of I [X = O, R1R2 = (CH2)4] with aqueous formaldehyde in the presence of HCl and H2SO4 (50 s, 800 W) gave cucurbiturils II [X = O, n = 5 and 6, R1R2 = (CH2)4] in yields of 40% and 10%, resp.

AB Disubstituted cucurbiturils of formula I [X = O, S, NH; R = alkenyl, carboxyalkyl, hydroxyalkyl, (substituted) aryl, etc.] are prepared The disubstituted cucurbituril has two end functional groups that can covalently bind with a solid substrate or a biochem. useful compound to obtain a cucurbituril-bonded substrate, which enables application of the disubstituted cucurbituril as column packing materials for chromatog., additives to gas separation membranes, catalysts for various chemical reactions, chemical sensors, biol. sensors or as drug carriers (no data). Thus, di-m-nitrobenzil and urea were mixed with HCl to give di-m-nitrophenylglycoluril, which was reacted with glycoluril and formaldehyde, and the product reduced to give di-m-aminophenylcucurbit[6]uril.

* STRUCTURE DIAGRAM TOO LARGE FOR DISPLAY - AVAILABLE VIA OFFLINE PRINT *

AB A method for forming oligomers, i.e. cucurbit[n]uril compds. containing phthalhydrazide units in a macrocyclic wall thereof, comprises the step of reacting one or more phthalhydrazides or one or more compds. functionally equivalent thereto with one or more glycoluril cyclic ethers. This method of preparing cucurbit-type compds. using bis(phthalhydrazides) as glycoluril surrogates controls the size, shape and pattern of functional groups in cucurbit[n]uril (i.e. CB[n]) forming reactions. The compds. are used advantageously to form host-guest complexes or cucurbit[6]uril-trirotaxane compound Controlled oligomerization of compound (I) (R = CO₂Et) (10.00 g) with 5.25 g paraformaldehyde in the presence of 33.23 g p-MeC₆H₄SO₃H in ClCH₂CH₂Cl at reflux for 2 h yielded a mixture of (II), (III), (IV), (V), (VI) and higher oligomers. Through a combination of selective dissoln. and chromatog. sepsns., II 3.58, III 9.579, isomer of III 0.394, IV 0.026, V 0.164, and its isomer VI 0.120 g were obtained.

GI

I

AB Cucurbituril assemblies I [X_n , En = O, S, NR; R^1 , An, Dn, Yn, Zn = H, C1-20-alkyl, C2-20-alkenyl, C2-20-alkynyl, C1-20-alkoxy, C1-20-aminoalkyl, C5-20-cycloalkyl, C4-20-heteroalicyclicyl, C6-20-aryl, C6-20-heteroaryl (with the proviso that at least one of An or Dn = functional group for forming an assembly); n = 5-20], polyamine structures capable of binding thereto, affinity pairs of cucurbituril assemblies and such polyamine structures and methods utilizing same are disclosed. Thus, cucurbit[6]uril [I; An = Dn = Yn = Zn = H, En = Xn = O, n = 1-6] was prepared from a mixture of glycouril and dimethylcyclopentanoglycouril via cyclization with CH_2O in the presence of H_2SO_4 , followed by affinity chromatog. Affinity pairing of I (An = Dn = Yn = Zn = H, En = Xn = O, n = 1-6) was accomplished with 2,4-hexadiyne-1,6-diamine dihydrochloride, 3-hexyne-1,6-diamine dihydrochloride and 2,4,6-octatriyne-1,8-diamine dihydrochloride.

AB	The invention relates to a mol. probe (MS) for detecting an analyte (AN), comprising: a basic structure (GS); at least two groups of detectors (D1, D2) that are directly or indirectly bound to the basic structure (GS) and can simultaneously interact with the analyte (AN); at least two groups of signals (S1, S2) which are directly or indirectly bound to the basic structure (GS); at least one signaling conformation of the mol. probe (MS), in which the groups of signals (S1, S2) interact with each other in such a way that a detectable signal is generated; and at least one mute conformation in which the detectable signal is not generated. The inventive probe combines the functions required for detecting an analyte, i.e. detection, signal transduction, and signal generation, and can be easily adapted to different detection problems as a result of the modular structure thereof.

ASSIGNMENT HISTORY FOR US PATENT AVAILABLE IN LSUS DISPLAY FORMAT
 GI

I

AB A cucurbituril-containing polymer, in which a particle-type polymer with a reactive end-substituted group is linked to a cucurbituril derivs. (I) ($n = 4-20$ integer, $R1 = C2-20$ alkenyloxy group with unsatd. end bond, $C2-20$ carboxyalkylsulfanyloxy group, $C2-8$ carboxyalkyloxy group, $C1-8$ aminoalkyloxy, $C1-8$ hydroxyalkyloxy group, or $C2-8$ epoxyalkyloxy group) by a covalent bond. A stationary phase for column chromatog. and a monolithic column using the above polymer is also provided. Thus, a chlorine-containing Merrifield polymer was reacted with a cucurbituril derivative (I) with $n = 6$ and $R1 = 2$ -hydroxyethyloxy group in the presence of potassium carbonate to receive a polymer particle.

AB The invention provides a method and device for sequencing at least a fragment of a linear polymer. The device comprises a well for placement of a rotaxane comprising the combination of a cyclic mol. and a linear polymer threaded through said cyclic mol.; a probe having the ability to move the linear polymer relative to the cyclic mol. while producing a signal resulting from the interaction of the cyclic mol. and a unit attached to the polymer; and means for reading said signal. The process comprises formation of the rotaxane, attachment of the probe, movement of the cyclic mol. relative to the linear polymer and the reading of signals. The device and method are especially useful for the sequencing of DNA.

AB The present invention relates to a complex composed of cucurbituril and fullerene and a method for manufacturing the complex on a solid-phase. A complex in accordance with the present invention can be usefully used as a medicine delivery means in the field of pharmaceuticals. Thus, cucurbit[7]uril-[60]fullerene complex was produced by crushing a mixture of 20.1 mg (28+10-3 mmol) [60]fullerene and 16.3 mg (14+10-3 mmol) cucurbit[7]uril (CB[7]) in a chrome steel mixing crusher using chrome steel crushing balls with the speed of 20 rpm for 1 to 10 h. After washing-out the produced CB[7]-C60 fullerene complex with warm water, 2 M NaOH was added to the solution to control its pH to be 12, followed by adding 20 mL toluene to dissolve the remaining CB[7] and non-coupled [60]fullerene. After dissolving excessive initial compds. by agitation the mixture for 30 min, the complex was allowed to precipitate. The aqueous phase containing the insol. complex was frozen, so that the upper organic phase could be decanted. After leaving the aqueous-phase until it got back to room temperature, it was centrifuged at 0° with 5000 rpm for 10 min, and then water was poured out carefully. After washing the complex with pure water until its pH got to be neutral, the remained water was finally evaporated and the dark-brown complex was vacuum-dried to obtain the complex having the 1:2 weight ratio of cucurbit[7]uril to [60]fullerene (33% yield).

AB In the title process, especially useful with clothing, the textiles are treated with aqueous compns. containing cucurbiturils and then dried, preferably at $\leq 80^\circ$ under normal pressure. The invention also relates to the use of cucurbiturils for providing textiles with a temporary deodorizing finish or for long-term scenting of textiles.

AB Cucurbits I [R = H, C1-6 (un)substituted alkyl, C2-6 (un)substituted alkenyl, (un)substituted Ph; R1, R2 = H, C1-10 (un)substituted alkyl, (un)substituted Ph], useful for removing O, N, CO, CO2, CO, Ar, etc., are prepared by treatment of RCHO (R = same as above) with glycoluril derivs. II (R1, R2 = same as above) and NH4Cl in the presence of HCl, separating the resulting NH4Cl adducts, converting them into NH4OH adducts, and heating (in vacuo) to remove NH3. Alternatively, the glycoluril derivs. are stepwise treated with the aldehydes in the presence of HCl, and with NH4Cl. Thus, II (R1 = R2 = Me) was treated with NH4Cl, concentrated HCl and formalin at 80° for 6 h,

concentrated, treated with Amberlite IRA 410 (anion exchanger), and heated at 80° to give almost quant. I (R1 = R2 = Me).

AB Provided are hydroxycucurbituril derivs., e.g., I [A1, A2 = OH, (un)substituted C1-30-alkoxy, C1-30-alkenyloxy (sic), C1-30-alkynyloxy (sic), C2-30-carbonylalkoxy, C1-30-thioalkoxy, C1-30-alkylthiooxy, C1-30-hydroxyalkoxy, C1-30-alkylsilyloxy, C1-30-aminoalkoxy, C1-30-aminoalkylthioalkoxy, C5-30-cycloalkoxy, C2-30-heterocycloalkoxy, C6-30-aryloxy, C6-20-arylalkoxy, C4-30-heteroaryloxy, C1-30-alkylthio, C1-30-alkenylthio (sic), C1-30-alkynylthio (sic), C2-30-carbonylalkylthio, C1-30-alkylsilylthio, C1-30-aminoalkylthio, C1-30-aminoalkylthioalkylthio, C5-30-cycloalkylthio, C2-30-heterocycloalkylthio, C6-30-arylthio, C6-20-arylalkylthio (sic), C4-30-heteroarylthio, C4-30-heteroarylalkylthio, C1-30-alkylamino, C1-30-alkenylamino (sic), C1-30-alkynylamino (sic), C2-30-carbonylalkylamino, C1-30-thioalkylamino, C1-30-hydroxyalkylamino, C1-30-alkylsilylamino, C1-30-aminoalkylamino, C5-30-cycloalkylamino, C2-30-heterocycloalkylamino, C6-30-arylamino, C4-30-heteroarylamino; A1 = A2 = H; X = O, S, NH; n = 4 - 20], their preparation methods and uses. Thus, hydroxycucurbit[6]uril (I; A1 = A2 = OH, X = O, n = 6) was prepared in 55% yield from cucurbit[6]uril (I; A1 = A2 = H, X = O, n = 6) via oxidation with aqueous K2S2O8. The hydroxycucurbituril derivative is easy to further functionalize with enhanced solubility in common solvents, thereby providing wider applications, e.g., in agrochems., cosmetics, medicinals and wastewater treatment. Hydroxycucurbit[6]uril formed: a 1:1 host-guest complex with THF; a 1:1 host-guest complex with isobutene; and formed an ion selective membrane with polyvinyl chloride.

GI

I

II

AB The present invention provides an inclusion compound having a variety of cucurbituril derivs. I, e.g., cucurbitu[7]ril, as a host mol. and metal complexes II (representing a wide variety of complexes), and especially platinum complexes, e.g., oxaliplatin, as a guest mol. A pharmaceutical composition having an anticancer effect can be obtained by using the inclusion compound according to the present invention. The pharmaceutical composition can prevent effective components from being biol. degraded in vivo and can exhibit continuous drug effect for a long time, just by a single dosage, by controlling the release time of the Pt complex once it reaches target tumor cells. The inclusion compound is used for treatment of cancer, including ovarian cancer, breast cancer, or colon cancer. Antiproliferative activities are reported of oxaliplatin-cucurbitu[7]ril 1:1 inclusion compound against A 549 (human non-small lung), SKOV-3 (human ovarian), SKMEL-2 (human melanoma), XF-498 (human CNS), and HCT-15 (human colon).

OS CASREACT 138:89832; MARPAT 138:89832

AB Cucurbituril derivs. possessing oxo, thioxo, and imino groups, hydrogen, various alkyl or alkyl derived substituents, as well as cycloalkyl chains encompassing the bridge carbons were prepared. The compds. can be used in ion sensors where the ion sensor is used to detect heavy metals such as lead, mercury, alkaline earth metals, and alkali metals. In addition, the ion sensor can be used to detect organic matter including acetylcholine, ammonium ions, organic amines, amino acid or derivs., and nucleic acid bases. These compds. can also be used to remove organic dyes from wastewater, heavy metals from water, and radioactive isotopes from radioactive wastes; they also can be used to capture and remove unpleasant odor and air pollutants, and to deodorize and decolorize livestock wastewater and ironwork wastewater. These derivs. can also be used as additives to polymers, cosmetics, artificially scented paper or textiles, pesticides, drugs, or foods. The authors also claim that these cucurbituril derivs. are useful as drug carriers, for extraction and purification of fullerene or carboranes, as packing material for chromatog. columns, as additives to gas separation membranes, and as catalysts for various chemical reactions. The cucurbituril derivs. have enhanced solubility in common solvents, thereby providing wider applications.

GI

AB The invention relates to novel inorg. absorbent composites consisting of an open-pore, solid, inorg. matrix, comprising cucurbiturils of general formula (I) which are chemical linked in the matrix. Said cucurbiturils form a macrocycle having a cage structure, consisting of n repeating units, wherein n is a whole number 5, 6, 7 or 8, R represents hydrogen or C1-C5 alkyl, and X represents O, S or N. X and R can be the same or different. Said composites are produced by reacting cucurbituril with an inorg. matrix-forming agent, such as silica gel, at 15 to 90°C in a liquid medium. The inventive composites can be used as absorption materials and catalyst supports.

 AB A new gas filter material from natural or synthetic fibers or combination thereof contains relative to weight by unit area of 0.01-60 weight % macrocyclic organic cage compds such as cyclodextrins and/or cucurbituril. The composition meets tech. requirements for stability and porosity and can be used loaded or not loaded for vacuum bags, vacuum exhaust gas filters and/or as gas filter material in air conditioners and climate control units. The filter material is loaded with with olfactory materials or biocides using water, without an addnl. binder. As function the filter is suitable to sep. or enrich substances. The scented substances provide pleasant additives for the airstream emitting from the filter while biocide loading can inhibit and decompose the growth of fungi and bacteria.

AB The dyeing bath containing dyes and dyeing aids is contacted with glycoluril-HCHO condensates, separated into dye-taken condensates and water to return water to the dyeing process. The dye-taken condensates are treated with (A) ≥ 1 water-soluble organic solvents selected from formamide, DMF, DMSO, ethylene glycol, propylene glycol, diethylene glycol, triethylene glycol, and tetraethylene glycol and/or (B) 1/10,000-1/10 N aqueous solution of NaOH, KOH, Na₂CO₃, K₂CO₃, NaHCO₃, and/or KHCO₃ to release the dye from the condensates. Thus, an aqueous solution containing 500 ppm Cibacron Red 4G-E-01 (reactive dye) and 10% Na₂SO₄ was mixed with 2000 ppm cucurbituril precursor to give decolorized water with little change of other component compns.

AB Cucurbituril derivs. I [X = O, S, NH; R1, R2 = H, alkyl, alkenyl, alkynyl, alkylthio, acyloxy, hydroxyalkyl, alkylsilyl, alkoxy, haloalkyl, NO2, alkylamino, amino, aminoalkyl, cycloalkyl, heterocyclic, aryl, heteroaryl; x = 4-20; I, x = 6, R1 = R2 = H, X = O; x = 5, R1 = Me, R2 = H, X = O, excluded] were prepared. The cucurbituril derivs. are easily prepared as a mixture by one of three methods, and each cucurbituril derivative can be separated from the mixture by fractional crystallization. I or their mixts. are very useful in removing dyes and heavy metal ions dissolved in water or waste water. They also bind heavy metals, radioactive isotopes, CO, CO2, NOx, SOx, amines, amino acids, nucleic acid bases, alkali metals and alkaline earth metals.

PRAI	DE 1996-19603377		19960131	<--	

OS CASREACT 127:205599

AB Cucurbituril (I) was prepared by (1) dissoln. of acetylenediurea (II) in aqueous mineral acid in the presence of excess formaldehyde under heating, (2) removal of H₂O via distillation, and (3) heating the resulting polymer to give crystalline I. Thus, II was added to aqueous H₂SO₄ containing aqueous formaldehyde under heating and stirring; H₂O was removed by distillation to give a residue which was heated to 135-145°. Heating was discontinued when formaldehyde cleavage began, and self-heating brought the reaction temperature to 165°. The mixture was stirred a further 15 min. and the resulting crystals were cooled and added to H₂O to give 82.4% I.

AB The title materials, having microcapsules prepared by coating a core containing photosensitive Ag halides, reducing agents, and polymerizing compds. with an aldehyde polycondensation resin shell on a support, contain a glycoluril compound. The materials may be heat-developable and contain a base precursor and are imagewise exposed and then heat-treated to polymerize the polymerizing compds. to form images. The vaporization of aldehyde from the materials is reduced. The compound I is used as an aldehyde scavenger.

AB Water-soluble glycolurils (I; R, R1, R2 = H, alkyl, alkenyl, aralkyl, aryl, or acyl; R3, R4 = H or alkyl) or polymers thereof are described for use as aldehyde gas scavengers in color photog. materials. These compds. are incorporated in an underlayer, protective layer, interlayer, filler layer, antihalation layer, or other layer at 0.01-5 g/m2. Thus, a subbed cellulose acetate support was coated with a green-sensitive gelatin-Ag(Br,I) emulsion containing a magenta coupler and then with a protective layer containing gelatin 1.5 and I (R, R2, R3, R4 = H; R1 = Me) (II) 0.6 g/m2. The resultant film was then exposed, color developed, bleached, washed, fixed, washed, and stabilized to give a magenta image which was then exposed to HCHO to show a decrease in d. of 5% vs. 40% for a II-free control.

AB Water-insol. monoazo dyes of the general formula I are described for the dyeing of artificial fibers in red shades of high light-fastness. In I, nucleus B may have a halogen atom, R and R' are CH₂CH₂CN or CH₂CH₂CO₂Me. The benzothiazoles are prepared by ring closure of the appropriate phenylthioureas. Thus, 5.14 parts 2-amino-6-dimethyl-sulfamoylbenzothiazole (II) was diazotized and coupled with 3.98 parts PhN(CH₂CH₂CN)₂ to give a dye, which when milled with aqueous di-Na dinaphthylmethanedisulfonate colors cellulose acetate in brilliant scarlet shades of excellent lightfastness. Similarly, diazotized II and PhN(CH₂CH₂CO₂Me)₂ give a red dye. The following benzothiazole derivs. were prepared (substituents, m.p., reagents given): 2-NH₂-6-MeNHSO₂, 229-30°, Br, 4-H₂NC₆H₄SO₂NHMe, and KSCN; 2-NH₂-6-HOCH₂CH₂NHSO₂, 194°, Br, 4-H₂NC₆H₄SO₂NHCH₂CH₂OH, and KSCN; and 2-NH₂-6-iso-PrNHSO₂, 214-15° Br, 4-H₂NC₆SO₂NH-iso-Pr, and KSCN. Iso-PrNH₂ and 4-AcNHC₆H₄SO₂Cl gave 4-AcNHC₆H₄SO₂NH-iso-Pr, m. 160.5-2.5°, which was hydrolyzed to 4-iso-Pr-NHSO₂C₆H₄NH₂, m. 116.5-17°. 2-O₂NC₆H₄SO₂Cl and Me₂NH gave 2-O₂NC₆H₄SO₂NMe₂ which was reduced and treated with BzSCN to give 2-Me₂NSO₂C₆H₄NHC(:S)NHBz, m. 157.5-8°, which was treated with Br in CHCl₃ to give the 4-Me₂NSO₂ analog, m. 284°, of II. Similarly was prepared the 4-chloro derivative, m. 251-2°, of II from 3,4-Cl₂C₆H₃SO₂NMe₂ (III), m. 127-8°; then the 4-NH₂ analog, m. 174-5° of II; then 2,4-Cl(Me₂NSO₂)C₆H₃NHC(:S)NHBz, m. 196-7°, then 2,4-Cl(Me₂NSO₂)C₆H₃NHC(:S)NH₂, m. 150-1°.

AB Cotton dyes of the formula I, in which D is the residue of an azo or anthraquinone dye, m is 1-2, and n is 1-3 have excellent fastness properties. They are prepared by conventional methods. Thus, 23.3 parts N-(4-aminophenyl)glyoxaldiureine (II) is diazotized and coupled with 22.4 parts 2,5-HOC10H6SO3H. The product is salted out, filtered, stirred as an aqueous paste for 20 hrs. at room temperature with 15% aqueous HCHO 100 and NaOH 2 parts. The brilliant red dye is salted out, filtered, and dried at 40-50° in vacuo. Glyoxalmonoureine di-Me ether (IIa) (0.9 part) is dissolved at 85° in a solution of 4-AcNHC6H4NHCONH2 1 in 3% AcOH 30, concentrated HCl 0.6 part is added, the solution is heated at 85° for 20 min., and cooled to give 1.2 parts N-(4-acetamidophenyl)glyoxaldiureine (III). The hydrolysis of III with 4% aqueous NaOH yields 0.5 part II. Other dyes are prepared similarly (reactants, shade on cotton given): N-(4-amino-3-sulfophenyl)glyoxaldiureine (IV), 2,7-HOC10H6SO3H, brilliant red; IV, 1-(2-chloro-5-sulfophenyl)-3-methyl-5-pyrazolone, brilliant red; 4-H2NC6H4SO3H, N-(4-hydroxyphenyl)glyoxaldiureine (V), yellow; 2-H2NC6H4CO2H, N-(8-hydroxy-6-sulfo-2-naphthyl)glyoxaldiureine (VI), orange-red; II, VI, brilliant red; 4-O2NC6H4NH2 → H acid, IV, navy blue; 2,4-HO(O2N)C6H3NH2, V (Cr complex), brown. Similarly, 1-amino-4-(4-ureidoanilino)-2-anthraquinonesulfonic acid and IIa gave a brilliant blue dye.
